40Ar/39Ar Analysis for National Argon Map

By Marnie Forster and Davood Vasegh

## NAM Proposal 06:

### New Ar-Ar geochronology age constraints on the Lord Howe Seamount Chain

#### Methods and procedures

##### Sample selection and mineral separation:

The samples in this study were provided by Geological Survey of New South Wales and the mineral separation procedures were undertaken in rock crushing and mineral separation laboratories at The Australian National University (Table 1) No chemical or leaching treatments were used during separation.

Mineral separation begins by choosing the most pristine sections with no evidence of weathering or staining. For samples with a targeted microstructure, the rock is first sliced into thin slabs using a trim saw, the selected area was then cut from the rock using a band saw. Once the selected area was separated, it was then crushed, milled and de-slimed as many times as was necessary to clean the grains and finally washed in deionised water.

##### Whole rock crush procedure:

For whole rock the crushed grains are sieved into size fractions: 250-420µm. A final check and hand-picking of the best quality aggregates was done in the Argon Preparation Laboratory.

##### Mineral separation details:

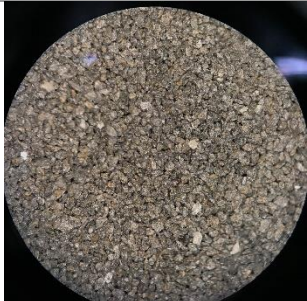

Sample ID	Target Mineral	Mass (mg)	Grain Size (µm)	Treatment / Comment	Picture
NSWSPJG0075	Basalt (WR)	144.1	250-420	Dark black basalt grains, clean fraction	
		299.7			

Table 1: Mineral separation details

##### Sample irradiation details:

Irradiation of samples for  $^{40}\text{Ar}/^{39}\text{Ar}$  analysis was undertaken at the University of California Davis McClellan Nuclear Research Centre, CA, US in Central Facility position of TRIGA reactor without rotation, with 1.0mm of Cadmium shielding as ANU CAN #37 for 8.00 hours on 12 December 2020.

The calculated amounts of grains were weighed and recorded and then wrapped in labelled aluminium packets in preparation for irradiation. The sample filled foils were placed into a quartz irradiation canister together with aliquots of the flux monitor Biotite GA1550. The foil packets of GA1550 standards were dispersed 6-8mm apart throughout the irradiation canister, between the unknown age samples. In addition, packets containing  $K_2SO_4$  and  $CaF_2$  were placed in the middle of the canister to monitor argon isotope production from potassium and other interfering elements. Irradiated samples were unwrapped upon their return to the Australian National University, and then rewrapped in tin foils in preparation for analysis under vacuum in the furnace. Tin foil is used because the melting temperature of tin is lower than the experiment starting point in the furnace and gasses from tin can be pumped away prior to the sample analysis.

## **$^{40}Ar/^{39}Ar$ procedures and analysis information**

### **Methodology:**

Temperature-controlled resistance furnace step-heating experiments is the technique that is used in the ANU Argon laboratory to extract argon isotopes from the samples to ensure 100% release of  $^{39}Ar$ . A sample is dropped into a cleaned furnace and heated to 400°C to melt the tin foil and then left in the furnace at 350°C for 8-12 hours to pump away unwanted gases. This cleaning procedure has proven to significantly improve the quality of the resultant data. The step-heating experiment then starts at 450°C, and each incremental heating step is heated at a constant temperature for 15 minutes. The heating process involves rapid heating to the setpoint temperature with no overshoot, then temperature is maintained for 15 minutes followed by rapid cooling; this procedure produces a square wave in temperature for each heating step. The heating step schedule for biotite and muscovite rises by 30°C increments (except for the last a few steps), with 30 steps per sample, while K-feldspar is analysed in more than 40 steps, including numerous isothermal steps. Diffusion experiments, as conducted in the ANU Argon laboratory, are designed to retrieve diffusion parameters which can be used in quantitative temperature-time modelling. The heating schedules are recorded in the Excel Tables for each sample.

Cleaning of the furnace between samples is vital in this method. The furnace is degassed four times at 1,450°C for 15 minutes and the gas pumped away prior to the loading of the subsequent sample. Blanks are measured to monitor the cleaning process. The flux monitor crystals are fused using a  $CO_2$  continuous-wave laser. Gas released from either the flux monitors or each step of the sample analyses are exposed to three Zr-Al getters; two AP10 (Cold and hot) and one CP50, each for 10 minutes, to remove active gases. The purified extracted gasses are then isotopically analysed in the Argus VI mass spectrometer. The  $^{40}Ar/^{39}Ar$  dating technique is adapted from McDougall and Harrison (1999) and described in Forster and Lister (2009).

Background levels are measured and subtracted from all analyses, from flux monitors and samples. The nuclear interfering values for the correction factors for the isotopes are listed below (Tetley et al 1980). These are measured for the reactions and uncertainties of  $(^{36}Ar/^{37}Ar)_{Ca}$ ,  $(^{39}Ar/^{37}Ar)_{Ca}$ ,  $(^{40}Ar/^{39}Ar)_K$ ,  $(^{38}Ar/^{39}Ar)_K$  and  $(^{38}Ar)_{Cl}/(^{39}Ar)_K$ , and were calculated prior to sample analyses.

### **Mass spectrometer setup and procedures**

Samples and standards were analysed in the Argon Laboratory at the Research School of Earth Science, The Australian National University, Canberra, Australia using a *Thermo Fisher ARGUS-VI* multi-collector mass spectrometer (Table 2).

Mass Spectrometer: Thermo Fisher Argus VI  
 Detector Type: Faraday Cups only x5  
 Calibrations: 3 levels (Zero Offset, Gain and Cross Calibration)  
 Peak Centring: Once for every measurement @H2 (<sup>40</sup>Ar)  
 Measurement Cycles: 51 cycles on all detectors  
 Extrapolation Method: Exponential extrapolation and uncertainty

Name	UFC Offset [fA]	Gain	Cross Calibration Factor
H2	-4.9761469	0.9871203	1
H1	-2.2071069	0.9671459	1.007184188
AX	-7.6814703	0.9769602	1.017518151
L1	-2.3979322	0.9706487	1.030604297
L2	-3.1329948	0.9676338	1.047244337

Table 2: Detector Calibration Values

**The calculation parameters:**

Lambda <sup>40</sup>K (Renne et al 2011) 5.5305E-10  
 Lambda <sup>37</sup>Ar (Kondev et al 2017) 1.9798E-02  
 Lambda <sup>39</sup>Ar (Kondev et al 2017) 7.0548E-06  
 Lambda <sup>36</sup>Cl (Kondev et al 2017) 6.2985E-09  
 Flux Monitor GA1550 @ 99.18 ± 0.14 Ma  
 Total irradiation power 8.00 MW  
 Irradiation Date 12 Dec, 2020  
 Irradiation shielding Cadmium 1.0mm

**Interfering isotope production ratios:**

(<sup>36</sup>Ar/<sup>37</sup>Ar)<sub>Ca</sub> correction factor 1.39373E-04  
 (<sup>39</sup>Ar/<sup>37</sup>Ar)<sub>Ca</sub> correction factor 1.28113E-03  
 (<sup>40</sup>Ar/<sup>39</sup>Ar)<sub>K</sub> correction factor 3.68304E-02  
 (<sup>38</sup>Ar/<sup>39</sup>Ar)<sub>K</sub> correction factor 1.15198E-02  
 (<sup>38</sup>Ar)<sub>Cl</sub>/<sub>(<sup>39</sup>Ar)<sub>K</sub> correction factor 8.04118E-02  
 Ca/K conversion factor 1.90</sub>

**Atmospheric Argon correction ratio:**

<sup>40</sup>Ar/<sup>36</sup>Ar (Lee et al 2006) 298.57  
<sup>40</sup>Ar/<sup>38</sup>Ar (Lee et al 2006) 1,583.52

**Representative air shot and blanks measurements:**

The discrimination factor was calculated by analysing five air shots analysis on either side of sample analysis and the calculation of the 1amu was used for the discrimination factor. Table 3 shows an example of the analysed air shots.

Date	<sup>40</sup> Ar ± %err		<sup>38</sup> Ar ± %err		<sup>36</sup> Ar ± %err		1amu ± %err		Reported Value
07-Apr-2021	1,902.294	0.011	1.188	1.412	6.439	0.276	1.00265	0.148	1.0021836 ± 0.096%
07-Apr-2021	1,898.336	0.011	1.151	1.631	6.397	0.272	1.00152	0.146

Table 3: Air Shots and Mass Discrimination Factor

The blank measurements are undertaken with different temperature schedules between 300°C and 1450°C, depending on the degassing behaviour and previous blank measurement results. The

degassing and blank measurement procedure continues until the ratios of  $^{40}\text{Ar}$ ,  $^{38}\text{Ar}$  and  $^{36}\text{Ar}$  drop to atmospheric ratios, and  $^{39}\text{Ar}$  and  $^{37}\text{Ar}$  drop below detectable levels. The entire procedure of degassing and blank measurements is repeated at the end of a set of samples. Blanks will be done in-between samples that belong to a set, with reduced steps at 300°C, 1300°C and 1450°C to check isotope levels. In addition, the mass of each sample is calculated so that the volume of gas released from each step overwhelms the volume of gas that may occur in the blank. The table 4 is a representative sequence of measured blank values recorded during a monitoring process.

Temperature	$^{40}\text{Ar}$	$^{39}\text{Ar}$	$^{38}\text{Ar}$	$^{37}\text{Ar}$	$^{36}\text{Ar}$	$^{40}\text{Ar}/^{36}\text{Ar}$
300	390.4368171	0.905537608	0.225735172	*	1.270363042	307.3427
500	395.5969863	0.774176443	0.200701385	*	1.290189995	306.6192
700	397.2960946	0.708335676	0.243386524	*	1.260730764	315.1316
900	436.6219355	0.649146429	0.246339898	*	1.426302145	306.1216

1450	1374.433483	0.664379683	0.800095274	*	4.461063725	308.0955

Table 4: Example of the blanks measurements during a sequence of blanks where isotopes were being monitored prior to sample analysis (\* => Not Detectable). Temperature is °C.

#### Data reduction software:

The calculations were done with an adapted version of *Noble Software* (2022, developed and adapted by the Australian National University Argon Laboratory) and all interpretations have been undertaken with *eArgon* (developed and adapted for ANU Argon Laboratory by G.S. Lister).

#### Reported Data:

The reported data have been corrected for system backgrounds, mass discrimination, fluence gradients and atmospheric contamination. GA1550 standards were analysed, and an exponential best fit was then used for the calculation of the J-factor and J-factor uncertainty (Table 5).

Samples J-Factor, Mass Discrimination, and uncertainties:

Sample Name	J-Factor ± %uncertainty		Mass Discrimination Factor ± %uncertainty		Measurement Date
NSWSPJG0075 (G1)	1.53061E-3	0.2203	1.00218	0.096	11-Apr-2021
NSWSPJG0075 (G2-3)	1.53126E-3	0.2202	1.00218	0.096	14-Apr-2021

Table 5: Sample analysis and calculation details

$^{40}\text{Ar}/^{39}\text{Ar}$  isotopic data of the samples are supplied in the Excel Data Tables, which include details on the heating schedule, Argon isotopes abundances and their uncertainty levels, %Ar\*,  $^{40}\text{Ar}^*/^{39}\text{Ar}(\text{K})$ , Cumulative  $^{39}\text{Ar}\%$ , calculated age and its uncertainty, Ca/K, Cl/K, J-Factor and its uncertainty. Noting that all the reported uncertainties are at one sigma level and the fractional uncertainties are shown as % in the headings of the appropriate columns of data tables. The components involved in the calculation of the uncertainties are listed in Table 6.

Uncertainty of:	Components involved in the calculation
Isotope Abundances	Uncertainty of isotope measurement Uncertainty of Mass Discrimination Factor (except for $^{39}\text{Ar}$ )
J-Factor	Uncertainty of $^{40}\text{K}$ Decay Constant Uncertainty of Age of the Flux monitor Uncertainty of Flux monitor isotopes abundances

Calculated Age	Uncertainty of Isotopes Abundances J-Factor value and uncertainty of J-Factor <sup>40</sup> K Decay Constant value and uncertainty of <sup>40</sup> K Decay Constant
----------------	---

Table 6: Components involved in the calculation of each uncertainty
