

National Argon Map: an AuScope Initiative

$^{40}\text{Ar}/^{39}\text{Ar}$ Geochronology Laboratory Sample Submission Form

This form must be completed and returned to Marnie Forster (Marnie.Forster@anu.edu.au) before any work can be commenced in the Argon Laboratories.

Person submitting samples: Ian T Graham
Affiliation: UNSW Sydney
Project Title: Age of basaltic intrusions within the Sydney Basin, NSW
Sample Number(s) (including IGSN if one exists): 1705A
Mineral separation required? Yes or No: Yes
Date submitted:

GEOGRAPHIC AREA/ PROVINCE/ BASIN : Sydney Basin	
1:250k SHEET NAME: Sydney	NUMBER: SI/56-5
1:100k SHEET NAME:	NUMBER:
LOCATION METHOD: (GPS: WGS84 / AGD66 / AGD84 / GDA94)	
ZONE: 56 H	
EASTING: 302348	NORTHING: 6154977
LATITUDE: 34 43 41.7	LONGITUDE: 150 50 28.5

STRATIGRAPHIC UNIT FORMAL NAME *: Wandrawandian siltstone
STRATIGRAPHIC UNIT INFORMAL NAME:
LITHOLOGY: Alkali basalt

DRILLHOLE ID (if applicable):
PROSPECT (if applicable):
DEPTH FROM (metres):
DEPTH TO (metres):

* Stratigraphic Unit names can be searched and checked within the Australian Stratigraphic Units Database via the following link: <https://asud.ga.gov.au/>

Dating Objective

What is the geological question $^{40}\text{Ar}/^{39}\text{Ar}$ analysis will address?

The magmatic age of crystallisation of the dyke and how this relates to other dated dyes/sills within the Sydney Basin.

What type of age(s) are expected? (e.g. magmatic crystallisation, metamorphism, fluid alteration/mineralisation, cooling, shearing etc):

Magmatic crystallisation

Mineral target(s) for dating:

Plagioclase separate if possible.

Estimated $^{40}\text{Ar}/^{39}\text{Ar}$ age (e.g. Cenozoic, Mesozoic, Paleozoic, Proterozoic, Archean – provide estimated numerical age range if possible):

The Bumbo Latite member of the nearby Gerringong Volcanic Complex has been dated at 265 Ma (Belica et al., 2017). However, Abu-Shamma (2018) showed that this dyke it is distinctly different in composition to the Gerringong Volcanics and also published analyses on other dykes within the Sydney Basin. It should be post-265 and going by the fresh olivine, most likely of Cenozoic age.

Sample Information

Location description (e.g. a sample of x was collected from y, z km from abc town):

Sample was collected from a rock platform to the north of Werri Beach, just south of Gerringong'

Lithological characteristics (rock description):

This is a relatively unaltered micro-porphyrific olivine basalt.

Relative age constraints (pertinent geological relationships with surrounding rock units and any previous geochronology):

This alkali basalt dyke intrudes the Wandrawandian siltstone (late Early Permian (273-271 Ma)).

Thin section description (if available):

This is a relatively fresh olivine-plagioclase-augite micro-phenocrystic basalt with a fine-grained groundmass of plagioclase, olivine and augite.

Photograph(s) e.g. field site, hand-specimen, photomicrograph:
